

Powerful antiviral solutions to protect employees and facilities from coronavirus

You have well established SOPs in your food safety program to address microbial concerns on processing equipment and products, but are you looking to do more to protect workers and surfaces in employee areas and H2A labor housing facilities from the new coronavirus? Highland Fresh Technologies features Selectrocide®, a highly effective disinfectant with EPA registration for use against coronavirus and numerous other microbial pathogens of concern. The same powerful disinfectant used in health care facilities can be used to protect employees in common areas and housing facilities without the corrosive or destructive issues associated with other products like bleach.

Powerful Surface Disinfection

Simply spray Selectrocide on surfaces such as tables, counter tops, door handles, bathroom fixtures, and any other hard surfaces you wish to disinfect. Follow label instructions for concentration and contact time, and either let the surface air dry or wipe away any remaining solution after the specified contact time has elapsed. Pre-clean any soiled areas as you normally would prior to disinfection.

Protecting Your People

For surface treatment in H2A housing, buses, and employee contact areas:

- Pre-clean any soiled surfaces using your traditional cleaning products, then follow with Selectrocide disinfectant solution
- Selectrocide disinfectant: Follow label instructions for concentration and contact time for coronavirus
- Increase the frequency of cleaning and disinfection in housing facilities, focusing on common areas and frequently touched surfaces
- Selectrocide solution can be supplied via an automated dilution station or mixed in small quantities by hand if desired. We have convenient solutions for any size facility.

Frank Kelsey helps growers, packers and processors of fresh fruit and vegetable products address food safety and shelf-life extension challenges. He has multiple publications in the area of produce safety research and has been an invited speaker at numerous industry technical conferences. He is trained on virus prevention in food processing by the International Association for Food Protection. He is the Chief Science Officer for Highland Ag Solutions.
